

Chapter 4: General Programming Techniques

Efficiency and \mathcal{O} -Notation

- Big-O: $\mathcal{O}(f)$: upper bound of the number of steps (modulo a constant factor).
The time complexity is a function of the constants in the specification.
- Typical time complexities

$\mathcal{O}(2^N)$	exponential
$\mathcal{O}(N^2)$	quadratic
$\mathcal{O}(N)$	linear
$\mathcal{O}(\log N)$	logarithmic

Invariance Theorem

$$\{P\} \mathbf{do} \ B_0 \rightarrow S_0 \ [] \ B_1 \rightarrow S_1 \ \mathbf{od} \{Q\}$$

provided that

- (i) $[P \wedge \neg B_0 \wedge \neg B_1 \Rightarrow Q]$
- (ii) P is invariant under S_0 and S_1 .
 - $\{P \wedge B_0\} S_0 \{P\}$
 - $\{P \wedge B_1\} S_1 \{P\}$
- (iii) bound function t such that
 - $[P \wedge (B_0 \vee B_1) \Rightarrow t \geq 0]$
 - $\{P \wedge B_0 \wedge t = C\} S_0 \{t < C\}$
 - $\{P \wedge B_1 \wedge t = C\} S_1 \{t < C\}$

How to find a suitable invariant?

Taking Conjunctions as Invariant

$$\{\overline{P}\} \text{do } \neg Q \leftarrow S \text{ od } \{P \wedge Q\}$$

- *Example 1: Design S meeting*

$$\{true\} S \{x \leq y\}.$$

Taking *true* as invariant P , $x \leq y$ as Q , we have

$$\{true\} \text{do } x > y \leftarrow x, y := y, x \text{ od } \{x \leq y\}$$

(Note: (1) $x - y$ is a bound function. (2) $x := x - 1$ is also fine.)

- *Example 2: Design S meeting*

$\{true\} S \{a \leq b \wedge b \leq c \wedge c \leq d\}.$

Taking *true* as invariant P , we have

```

{true}
do  $a > b \rightarrow a, b := b, a$ 
     $b > c \rightarrow b, c := c, b$ 
     $c > d \rightarrow c, d := c, b$ 
od
 $\{a \leq b \wedge b \leq c \wedge c \leq d\}$ 

```

(Why does it terminate?)

- *Example 3.* Design *divmod* meeting the specification:

```

||
con A, B : int {A ≥ 0 ∧ B > 0}
var q, r : int
divmod
{q = A div B ∧ r = A mod B}
||

```

Note that according to the definitions of **div** and **mod**, the post-condition *R* is

$$R : A = q * B + r \wedge 0 \leq r \wedge r < B.$$

What is a suitable invariant?

From the post-condition

$$R : A = q * B + r \wedge 0 \leq r \wedge r < B$$

we may choose as invariant

$$P : A = q * B + r \wedge 0 \leq r$$

and as guard $\neg(r > B)$, leading to a program of the form:

$$\{P\} \mathbf{do} \ r \geq B \rightarrow S \ \mathbf{od} \{R\}.$$

- Initialization: $q, r := 0, A$, satisfying P
- Bound function: r
- Choose S as $r := r - B$.

$$\begin{aligned}
 &P(r := r - B) \\
 &\equiv \{ \text{substitution} \} \\
 &A = q * B + r - B \wedge 0 \leq r - B \\
 &\equiv \{ \text{calculus} \} \\
 &A = \overline{(q - 1)} * B + r \wedge B \leq r
 \end{aligned}$$

Having $q := q + 1$ can keep the invariant, i.e.,

$$P(q, r := q + 1, r - B) \Rightarrow P \wedge r \geq B.$$

This yields the following solution to *divmod*:

```

 $q, r := 0, A;$ 
 $\{\text{invariant: } A = p * B + r \wedge 0 \leq r, \text{ bound: } r\}$ 
do  $r \geq B \rightarrow q, r := q + 1, r - B$  od
 $\{R\}$ 

```

Replacing Constants by Variables

- *Example 1*

Consider the problem of computation of A to the power B for given naturals A and B :

```

||
con A, B : int;
var r : int;
exponentiation
{r = AB}
||

```

What is a suitable invariant P ?

We may introduce a *fresh variable* x and choose as invariant

$$P : r = A_x \wedge x \leq B$$

as as bound $B - x$. This yields the following program scheme:

$$r, x := 1, 0 \{P\}; \text{do } x \neq B \rightarrow S \text{ od} \{r = A_B\}$$

We investigate the efficient of increasing x by 1:

$$P(x := x + 1)$$

$$\equiv \{ \text{substitution} \}$$

$$r = A_{x+1} \wedge (x + 1) \leq B$$

$$\equiv \{ A_{x+1} = A_x * A \}$$

$$r = r * A \wedge x \leq B - 1$$

$$\equiv \{ \text{calculus} \}$$

$$r = r * \overline{A} \wedge x \leq B \wedge x \neq B$$

We obtain the following solution for *exponentiation*:

```

||
var  $x : int$ ;
 $r, x := 1, 0$ ;
{invariant:  $P$ , bound:  $B - x$ }
do  $x \neq B \rightarrow r, x := r * A, x + 1$  od
{ $r = A^B$ }
||

```

• *Example 2*

Derive a solution to *summation*, satisfying the following specification:

```

||
con  $N : \text{int} \{ N \geq 0 \}; f : \text{array} [0..N) \text{ of } \text{int};$ 
var  $x : \text{int};$ 
summation
 $\{ x = (\Sigma i : 0 \leq i < N : f.i) \}$ 
||

```

We may choose as

- invariant: $P = P_0 \wedge P_1$
- * $P_0 = \{ x = (\Sigma i : 0 \leq i < n : f.i) \}$, n is a fresh variable
- * $P_1 = 0 \leq n \leq N$: a bound for n
- bound function: $N - n$.

– Find initial values satisfying P :

$$x, n = 0, 0$$

– Investigate the effect of increasing n by 1 (according to the termination requirement), and we can get the following:

$$\{P \wedge n \neq N\} \ x, n = x + f.n, n + 1 \ \{P\}$$

– Final solution for *summation*:

```

||
var  $n : int; \{N \geq 0\}$ 
 $n, x := 0, 0;$ 
{invariant:  $P_0 \wedge P_1$ , bound:  $N - n$ }
do  $n \neq N \rightarrow x, n := x + f.n, n + 1$  od
||

```

- *Example 1*

Derive a program for the computation of Fibonacci function.

```

||
con  $N : \text{int} \{ N \geq 0 \};$ 
var  $x : \text{int};$ 
  fibonacci
  {  $x = \text{fib}.N$  }
||

```

where *fib* is defined by

$$\begin{aligned}
 \text{fib}.0 &= 0 \\
 \text{fib}.1 &= 1 \\
 \text{fib}.(n+2) &= \text{fib}.n + \text{fib}.(n+1)
 \end{aligned}$$

Strengthening Invariants

We may have as invariant $P_0 \wedge P_1$, where

$$P_0 \quad x = fib.n$$

$$P_1 \quad 0 \leq n \leq N$$

which is established by $n, x := 0, 0$. And we may take $N - n$ as bound function.

Notice that

$$P_0(n := n + 1; x := x) = E = fib.(n + 1)$$

$$= E = \dots x \dots n \dots ?$$

By strengthening invariant to $P_0 \wedge P_1 \wedge Q$, where

$$Q : y = fib.(n + 1)$$

and assuming $P_0 \wedge P_1 \wedge Q$, we have

$$\begin{aligned} P_0(n := n + 1) &= x = fib.(n + 1) \\ &= x = y \\ &= P_1(n := n + 1) \\ &= 0 \leq n + 1 \leq N \\ &\Rightarrow P_1 \wedge n \neq N \\ Q_0(n := n + 1) &= y = fib.(n + 1) + 1 \\ &= y = fib.n + fib.(n + 1) \\ &= y + x = y \end{aligned}$$

So we can obtain the following solution.

```

||
var  $n, y : \text{int}; \{N \geq 0\}$ 
 $n, x, y := 0, 0, 1;$ 
{invariant:  $P_0 \wedge P_1 \wedge Q$ , bound:  $N - n$ }
do  $n \neq N \rightarrow x, y, n := y, x + y, n + 1$  od
 $\{x = \text{fib}.N \wedge y = \text{fib}.(N + 1)\}$ 
||

```

This program has the complexity of $\mathcal{O}(N)$.

- *Example 2*

Derive, given array $f[0..N)$, a program for S , satisfying the following specification.

```

||
con  $N : \text{int} \{ N \geq 0 \}; f : \text{array}[0..N) [ \text{of } \text{int};$ 
var  $r : \text{int};$ 
 $S$ 
 $\{ r = (\#i, j : 0 \leq i < j < N : f.i \leq 0 \wedge f.j \geq 0) \}$ 
||
```

Derivation

1. Deriving Invariants.

By replacing constants by variables, we come up with the following invariants:

$$P_0 : r = (\#i, j : 0 \leq i < j < n : f.i \leq 0 \wedge f.j \geq 0) \\ P_1 : 0 \leq n \leq N$$

which are initialized by $n, r := 0, 0$.

2. We change $n := n + 1$, and derive programs keeping invariants. Assuming $P_0 \wedge P_1 \wedge n \neq N$, we have

$$\begin{aligned}
& (\#i, j : 0 \leq i < j < n + 1 : f.i \leq 0 \wedge f.j \geq 0) \\
= & \{ \text{split off } j = n \} \\
& (\#i, j : 0 \leq i < j < n : f.i \leq 0 \wedge f.j \geq 0) + \\
& (\#i : 0 \leq i < n : f.i \leq 0 \wedge f.n \geq 0) \\
= & \{ P_0 \} \\
& r + (\#i : 0 \leq i < n : f.i \leq 0 \wedge f.n \geq 0) \\
= & \{ \text{case analysis} \} \\
& r \quad \text{if } f.n < 0 \\
& r + (\#i : 0 \leq i < n : f.i \leq 0) \quad \text{if } f.n \geq 0 \\
= & \{ \text{introduction of invariant } Q : s = (\#i : 0 \leq i < n : f.i \leq 0) \} \\
& r \quad \text{if } f.n < 0 \\
& r + s \quad \text{if } f.n \geq 0
\end{aligned}$$

For the invariance of \hat{Q} , we derive, assuming $P_0 \wedge P_1 \wedge \hat{Q} \wedge n \neq N$,

$$\begin{aligned}
 & (\#i : 0 \leq i < n + 1 : f.i \leq 0) \\
 = & \{ \text{split off } i = n \} \\
 & (\#i : 0 \leq i < n : f.i \leq 0) + \#.(f.n \leq 0) \\
 = & \{ \hat{Q} \} \\
 & s + \#.(f.n \leq 0) \\
 = & \{ \text{definition of } \# \} \\
 & s \quad \text{if } f.n > 0 \\
 & s + 1 \quad \text{if } f.n \leq 0
 \end{aligned}$$

3. We summarize the above and obtain the following solution.

```

||
var  $n, s : \text{int}; \{N \geq 0\}$ 
 $n, r, s := 0, 0, 0;$ 
{invariant:  $P_0 \wedge P_1 \wedge Q$ , bound  $N - n$ }
do  $n \neq N \leftarrow$ 
  if  $f.n < 0 \rightarrow \text{skip}$ 
    ||  $f.n \geq 0 \rightarrow r := r + s$ 
  fi;
  if  $f.n > 0 \rightarrow \text{skip}$ 
    ||  $f.n \leq 0 \rightarrow s := s + 1$ 
  fi;
 $n := n + 1$ 
od
||
 $\{r = (\#_{i,j} : 0 \leq i < j < N : f.i \leq 0 \wedge f.j \geq 0)\}$ 

```

Exercises

Problem 4

Derive a solution for the following programming problem:

```

||
con  $N, X : \text{int} \{ N \geq 0 \}; f : \text{array} [0..N) \text{ of } \text{int};$ 
var  $r : \text{int}$ 
 $S$ 
 $\{ r = (\Sigma i : 0 \leq i < N : f.i * X^i) \}$ 
||.

```

Report 1

Please solve all the exercises so far (Problem 1 to Problem 4), and send your report by email to me (hu@mist.i.u-tokyo.ac.jp) no later than

May 31st, 2004.

Note that the subject of your email should be “MSP #1”.
