Chapter 4: General Programming Techniques

Strengthening Invariants (Cont.)

Maximum Segment Sum Problem

The problem of computing the maximal sum of the elements of segments A[p..q) of a given integer array A.

• Specification

```
\begin{array}{l} \textbf{con } N: int \ \{N \geq 0\}; \ A: \ \textbf{array} \ [0..N) \ \textbf{of} \ int; \\ \textbf{var } r: int; \\ maxsegsum \\ \{r = (\textbf{max} \ p, q \ : \ 0 \leq p \leq q \leq N \ : \ (\Sigma i: p \leq i < q: A.i))\} \\ \end{bmatrix} \\ \\ \end{array}
```

Derivation

From the post-condition:

$$R: \quad r = (\max p, q : 0 \le p \le q \le N : S.p.q)$$

 $S: \quad S.p.q = (\Sigma i : p \le i < q : A.i)$

we replace the constnat N by variable n, obtaining the invariants:

$$P_0$$
 $r = (\max p, q : 0 \le p \le q \le n : S.p.q)$
 P_1 $0 < n < N$

which are initialized by n, r := 0, 0.

We investigate the effect of incrementing n by 1. Assuming $P_0 \wedge P_1 \wedge n \neq N$, we have

```
(\max p, q : 0 \le p \le q \le n + 1 : S.p.q)
= \{ \text{ split off } q = n + 1 \}
(\max p, q : 0 \le p \le q \le n : S.p.q) \max
(\max p : 0 \le p \le n + 1 : S.p.(n + 1))
= \{ P_0 \}
r \max (\max p : 0 \le p \le n + 1 : S.p.(n + 1))
```

We introduce additional invariant Q:

 $r \max s$

```
Q: \ s = (\mathbf{max} \ p \ : \ 0 \le p \le n \ : \ S.p.n) Then Q(n := n+1) equals the relation that is needed, i.e.,  (\mathbf{max} \ p, q \ : \ 0 \le p \le q \le n+1 \ : \ S.p.q)  = \quad \{ \ \mathbf{previous} \ \mathbf{derivation} \ \}  r \ \mathbf{max} \ (\mathbf{max} \ p \ : \ 0 \le p \le n+1 \ : \ S.p.(n+1))  = \quad \{ \ \mathbf{assume} \ Q(n := n+1) \ \}
```

We thus obtain a solution of the following form.

```
\begin{array}{l} \text{var } n,s:int \\ n,r,s:=0,0,0; \\ \text{invariant: } P_0 \wedge P_1 \wedge Q, \text{ bound: } N-n; \\ \textbf{do } n \neq N \rightarrow \\ & \text{establish } Q(n:=n+1); \\ r:=r & \max s; \\ n:=n+1 \\ \textbf{od} \\ \end{bmatrix}
```

```
For Q(n := n + 1), we derive, assuming P_0 \wedge P_1 \wedge Q \wedge n \neq N,
          (\max p: 0 \le p \le n+1: S.p.(n+1))
     = { split off p = n + 1 }
          (\max p: 0 \le p \le n: S.p.(n+1)) \max S.(n+1).(n+1)
             \{ definition of S \}
          (\max p : 0 \le p \le n : S.p.n + A.n)) \max 0
             \{ + \text{ distributes over } \mathbf{max}, \text{ when the range is non-empty } (0 \le n) \}
          ((\max p: 0 \le p \le n: S.p.n) + A.n) \max 0
     = \{Q\}
          (s+A.n) \max 0
```

It follows that Q(n := n + 1) is established by $s := (s + A.n) \max 0$.

We therefore obtain the following $\mathcal{O}(N)$ program:

```
 \begin{aligned} &\text{var } n, s: int \\ &n, r, s:=0, 0, 0; \\ &\text{invariant: } P_0 \wedge P_1 \wedge Q, \text{ bound: } N-n; \\ &\textbf{do } n \neq N \to \\ &s:=(s+A.n) \text{ max } 0 \\ &r:=r \text{ max } s; \\ &n:=n+1 \end{aligned}
```

A nice solution to a not so simple problem!

Tail Invariants

Design a program whose post-condition is

$$R: r = F.N$$

where F is defined in the following tail-recursive way:

$$F.x = h.x$$
 if $b.x$
 $F.x = F.(g.x)$ if $\neg b.x$

What is a suitable invariant? \Rightarrow tail invariants!

A Direct Solution

```
var x;

x := X;

\{\underbrace{\text{invariant: } F.x = F.X, \text{ bound: assume that } F \text{ terminates}}\}

\mathbf{do} \neg b.x \rightarrow x := g.x \text{ od};

r := h.x

\| \{r := F.X\}
```

Solving Problems by Tail Invariants

• Example 1

Derive a program satisfying the following specification:

```
con N: int \{N \geq 0\}; A: array [0..N] of int; var r: int; S \{r = (\max i: 0 \leq i \leq N: A.i)\}
```

Define the function F by

$$F.x.y = (\mathbf{max}\ i : x \le i \le y : A.i)$$

which can be defined by the following tail recursion:

$$F.x.y = A.x if x = y$$

$$F.x.y = F.(x+1).y if A.x \le A.y$$

$$= F.x.(y-1) if A.y \le A.x$$

```
\begin{array}{l} \mathbf{var} \ x,y: int; \\ x,y:=0,N; \\ \{ \text{invariant} \ P: \ F.x.y = F.0.N \land 0 \leq x \leq y \leq N, \ \text{bound:} \ y-x \} \\ \mathbf{do} \ x \neq y \to \\ \quad \text{if} \ A.x \leq A.y \to x := x+1 \\ \quad [] \ A.y \leq A.x \to y := y-1 \\ \quad \text{fi} \\ \mathbf{od}; \\ r:=A.x; \\ \{r=(\mathbf{max} \ i: 0 \leq i \leq N: A.i) \}]| \end{array}
```

• Example 2:

Design a program with post-condition

$$r = G.N$$

where N is a natural number, and G.x is defined by

$$G.0 = 0$$

$$G.x = x \bmod 10 + G.(x \operatorname{div} 10)$$

Is G a tail recursion?

From

$$G.0 = 0$$

$$G.x = x \mod 10 + G.(x \operatorname{div} 10)$$

we can define a new function G' for accumulating the result with another argument r:

$$G.x = G'.x.0$$

where

$$G'.0.r = r$$

 $G'.x.r = G'.(x \text{ div } 10).(r + x \text{ mod } 10)$

... applying the standard method ...

What kind of G can be transformed into tail recursion?

Let \oplus is associative and has identity e. Then the function G defined by

$$G.x = a$$
 if $b.x$
 $G.x = h.x \oplus G.(g.x)$ if $\neg b.x$

can be transformed into

$$G.x = G'.x.e$$

where G' is a tail recursion defined by

$$G'.x.r = r \oplus a$$
 if $b.x$
 $G'.x.r = G'.(g.x).(r \oplus h.x)$ if $\neg b.x$

• Example 3

Reconsider the problem of computation of A to the power B for given naturals A and B:

```
|[
\mathbf{con}\ A, B: int;
\mathbf{var}\ r: int;
exponentiation
\{r = A^B\}
]|
```

The post-condition can be described by

$$r = G.A.B$$

where

$$G.x.0 = 1$$

 $G.x.y = 1 * G.(x * x).(y div 2)$ if $y mod 2 = 0$
 $= x * G.x.(y - 1)$ if $y mod 2 = 1$

What are h, g_1 and g_2 such that

$$G.x.y = a$$
 if $b.x.y$
 $G.x.y = h.x.y \oplus G.(g_1.x.y).(g_2.x.y)$ if $\neg b.x.y$

From

$$G.x.0 = 1$$

 $G.x.y = 1*G.(x*x).(y \text{ div } 2) \text{ if } y \text{ mod } 2 = 0$
 $= x*G.x.(y-1) \text{ if } y \text{ mod } 2 = 1$

we get the definition for h and g as follows.

$$h.x.y = 1$$
 if $y \mod 2 = 0$
 $= x$ if $y \mod 2 = 1$
 $g_1.x.y = x * x$ if $y \mod 2 = 0$
 $= x$ if $y \mod 2 = 1$
 $g_2.x.y = y \operatorname{div} 2$ if $y \mod 2 = 0$
 $= y - 1$ if $y \mod 2 = 1$

Therefore, we obtain the following program:

```
\begin{array}{l} \mathbf{var} \ x,y: \mathit{int}; \{A \geq 0, B \geq 0\} \\ r,x,y=1,A,B; \\ \{ \mathrm{invariant} \colon \ r*G.x.y=G.A.B \land 0 \leq 0, \ \mathrm{bound} \colon \ y \} \\ \mathbf{do} \ y \neq 0 \rightarrow \\ & \text{if} \ y \ \mathbf{mod} \ = 0 \rightarrow x,y, r=x*x,y \ \mathbf{div} \ 2, r*1 \\ & [] \ y \ \mathbf{mod} \ 2 = 1 \rightarrow x,y, r=x,y-1, r*x \\ & \text{fi} \\ \mathbf{od} \\ ] | \end{array}
```

An $\mathcal{O}(\log B)$ program!

Summary of Chapter 4

We discussed four general techniques that show how a suitable invariant may be derived from a given pre and post-condition.

- Taking conjuncts
- Replacing constants by variables
- Strengthening invariants
- Tail invariants

Exercises

```
[Problem 5-1] Solve
```

```
 \begin{aligned} & \text{con } N, X: int \ \{N \geq 0\}; \ f: \textbf{array} \ [0..N) \ \textbf{of} \ int; \\ & \textbf{var } r: bool \\ & S \\ & \{r \equiv (\exists i: 0 \leq i < N: f.i = 0)\} \\ & ]|, \end{aligned}
```

by defining for $0 \le n \le N$

$$G.n \equiv (\exists i : n \le i < N : f.i = 0)$$

and deriving a suitable recurrence relation for G.

[Problem 5-2] An h-sequence is either a sequence consisting of the single element 0 or it is a 1 followinged by two h-sequences. Syntactically, h-sequence may be defined by

$$h = 0 \mid 1 \; h \; h$$

Solve

```
con N: int \{N \geq 0\}; A: array [0..2*N+1) of [0..1]; var r: bool; S \{r \equiv A \text{ is an } h\text{-sequence}\}]|.
```

[Problem 5-3] Derive a program to solve the following problem.

```
\begin{array}{l} \textbf{con} \ N: int \ \{N \geq 0\}; \\ X,Y,Z,W: \ \textbf{array} \ [0..N) \ \textbf{of} \ int; \\ \textbf{var} \ r: int; \\ S \\ \{r = \{\#i,j,k,l:0 \leq i,j,k,l < N: X.i + Y.j + Z.k + W.l = 0\}\} \\ ]|. \end{array}
```

(Thanks to two students in the class!)
